Stack Overflow: Tag Prediction

1. Business Problem

1.1 Description

Description

Stack Overflow is the largest, most trusted online community for developers to learn, share their programming knowledge, and build their careers.

Stack Overflow is something which every programmer use one way or another. Each month, over 50 million developers come to Stack Overflow to learn, share their knowledge, and build their careers. It features questions and answers on a wide range of topics in computer programming. The website serves as a platform for users to ask and answer questions, and, through membership and

active participation, to vote questions and answers up or down and edit questions and answers in a fashion similar to a wiki or Digg. As of April 2014 Stack Overflow has over 4,000,000 registered users, and it exceeded 10,000,000 questions in late August 2015. Based on the type of tags assigned to questions, the top eight most discussed topics on the site are: Java, JavaScript, C#, PHP, Android, jQuery, Python and HTML.

Problem Statemtent

4/10/2019

Suggest the tags based on the content that was there in the question posted on Stackoverflow.

1.3 Real World / Business Objectives and Constraints

- 1. Predict as many tags as possible with high precision and recall.
- 2. Incorrect tags could impact customer experience on StackOverflow.
- 3. No strict latency constraints.

2. Machine Learning problem

2.1 Data

2.1.1 Data Overview

Refer: https://www.kaggle.com/c/facebook-recruiting-iii-keyword-extraction/data (https://www.kaggle.com/c/facebook-recruiting-iii-keyword-extraction/data)

All of the data is in 2 files: Train and Test.

Train.csv contains 4 columns: Id, Title, Body, Tags.

Test.csv contains the same columns but without the Tags, which you are to predict.

```
Size of Train.csv - 6.75GB
```

Size of Test.csv - 2GB

Number of rows in Train.csv = 6034195

The questions are randomized and contains a mix of verbose text sites as well as sites related to math and programming. The number of questions from each site may vary, and no filtering has been performed on the questions (such as closed questions).

Data Field Explaination

Dataset contains 6,034,195 rows. The columns in the table are:

```
Id - Unique identifier for each question
```

Title - The question's title

Body - The body of the question

Tags - The tags associated with the question in a space-seperated format
 (all lowercase, should not contain tabs '\t' or ampersands '&')

2.1.2 Example Data point

Title: Implementing Boundary Value Analysis of Software Testing in a C++ program?

Body:

```
#include<
        iostream>\n
        #include<
        stdlib.h>\n\n
        using namespace std;\n\n
        int main()\n
        {\n
                  int n,a[n],x,c,u[n],m[n],e[n][4];\n
                  cout<<"Enter the number of variables";\n</pre>
cin>>n;\n\n
                  cout<<"Enter the Lower, and Upper Limits of the
 variables";\n
                  for(int y=1; y<n+1; y++)\n
                  {\n
                     cin>>m[y];\n
                     cin>>u[y];\n
                  }\n
                  for(x=1; x<n+1; x++)\n
                  {\n
                     a[x] = (m[x] + u[x])/2; \n
                  }\n
                  c=(n*4)-4;\n
                  for(int a1=1; a1<n+1; a1++)\n
                  \{ \n \n
                     e[a1][0] = m[a1]; \n
                     e[a1][1] = m[a1]+1;\n
                     e[a1][2] = u[a1]-1;\n
                     e[a1][3] = u[a1]; \n
                  }\n
                  for(int i=1; i<n+1; i++)\n
                  {\n
                     for(int l=1; l<=i; l++)\n
                     {\n
                         if(1!=1)\n
                         {\n
                              cout<<a[1]<<"\\t";\n
                         }\n
                     }\n
                     for(int j=0; j<4; j++)\n</pre>
                     {\n
                         cout<<e[i][j];\n</pre>
                         for(int k=0; k< n-(i+1); k++) n
                         {\n
                              cout << a[k] << "\t"; \n
                         }\n
                         cout<<"\\n";\n
                     }\n
                       n\n
```

```
system("PAUSE");\n
return 0; \n
}\n
```

 $n\n$

The answer should come in the form of a table like $\n\$

1	50	50\n
2	50	50\n
99	50	50\n
100	50	50\n
50	1	50\n
50	2	50\n
50	99	50\n
50	100	50\n
50	50	1\n
50	50	2\n
50	50	99\n
50	50	100\n

 $n\n$

The output is not coming, can anyone correct the code or tell me what\'s w rong?
\n'

2.2 Mapping the real-world problem to a Machine Learning Problem

2.2.1 Type of Machine Learning Problem

It is a multi-label classification problem

Multi-label Classification: Multilabel classification assigns to each sample a set of target labels. This can be thought as predicting properties of a data-point that are not mutually exclusive, such as topics that are relevant for a document. A question on Stackoverflow might be about any of C, Pointers, FilelO and/or memory-management at the same time or none of these.

Credit: http://scikit-learn.org/stable/modules/multiclass.html (<a href="http://scikit-learn.org/sta

2.2.2 Performance metric

Micro-Averaged F1-Score (Mean F Score): The F1 score can be interpreted as a weighted average of the precision and recall, where an F1 score reaches its best value at 1 and worst score at 0. The relative contribution of precision and recall to the F1 score are equal. The formula for the F1 score is:

F1 = 2 (precision recall) / (precision + recall)

In the multi-class and multi-label case, this is the weighted average of the F1 score of each class.

'Micro f1 score':

Calculate metrics globally by counting the total true positives, false negatives and false positives. This is a better metric when we have class imbalance.

'Macro f1 score':

Calculate metrics for each label, and find their unweighted mean. This does not take label imbalance into account.

https://www.kaggle.com/wiki/MeanFScore (https://www.kaggle.com/wiki/MeanFScore) http://scikit-learn.org/stable/modules/generated/sklearn.metrics.f1_score.html (http://scikit-learn.org/stable/modules/generated/sklearn.metrics.f1 score.html)

Hamming loss: The Hamming loss is the fraction of labels that are incorrectly predicted. https://www.kaggle.com/wiki/HammingLoss (https://www.kaggle.com/wiki/HammingLoss)

3. Exploratory Data Analysis

3.1 Data Loading and Cleaning

3.1.1 Using Pandas with SQLite to Load the data

```
In [0]:
             #Creating db file from csv
             #Learn SQL: https://www.w3schools.com/sql/default.asp
          3
             if not os.path.isfile('train.db'):
                 start = datetime.now()
          4
          5
                 disk engine = create engine('sqlite:///train.db')
          6
                 start = dt.datetime.now()
          7
                 chunksize = 180000
          8
                 i = 0
          9
                 index start = 1
                 for df in pd.read_csv('Train.csv', names=['Id', 'Title', 'Body', 'Tags'],
         10
         11
                     df.index += index start
         12
                     print('{} rows'.format(j*chunksize))
         13
                     df.to_sql('data', disk_engine, if_exists='append')
         14
                     index start = df.index[-1] + 1
         15
         16
                 print("Time taken to run this cell :", datetime.now() - start)
```

3.1.2 Counting the number of rows

```
In [0]:
             if os.path.isfile('train.db'):
                 start = datetime.now()
          2
                 con = sqlite3.connect('train.db')
          3
                 num_rows = pd.read_sql_query("""SELECT count(*) FROM data""", con)
          4
          5
                 #Always remember to close the database
                 print("Number of rows in the database :","\n",num rows['count(*)'].values
          6
          7
                 con.close()
          8
                 print("Time taken to count the number of rows :", datetime.now() - start)
          9
             else:
         10
                 print("Please download the train.db file from drive or run the above cell
```

Number of rows in the database : 6034196
Time taken to count the number of rows : 0:01:15.750352

3.1.3 Checking for duplicates

```
In [0]:
             #Learn SQL: https://www.w3schools.com/sql/default.asp
             if os.path.isfile('train.db'):
          2
          3
                 start = datetime.now()
                 con = sqlite3.connect('train.db')
          4
          5
                 df_no_dup = pd.read_sql_query('SELECT Title, Body, Tags, COUNT(*) as cnt_
                 con.close()
          6
                 print("Time taken to run this cell :", datetime.now() - start)
          7
          8
             else:
                 print("Please download the train.db file from drive or run the first to g
          9
```

Time taken to run this cell: 0:04:33.560122

```
In [0]:
               df no dup.head()
                # we can observe that there are duplicates
Out[6]:
                                       Title
                                                                               Body
                                                                                             Tags
                                                                                                   cnt_dup

7 #Print the length of the list.
8 print ('{} Tags are used more than 100000 times'.format(len(lst_tags_gt_100k))
```

153 Tags are used more than 10000 times 14 Tags are used more than 100000 times

Observations:

- 1. There are total 153 tags which are used more than 10000 times.
- 2. 14 tags are used more than 100000 times.
- 3. Most frequent tag (i.e. c#) is used 331505 times.
- 4. Since some tags occur much more frequenctly than others, Micro-averaged F1-score is the appropriate metric for this probelm.

3.2.4 Tags Per Question

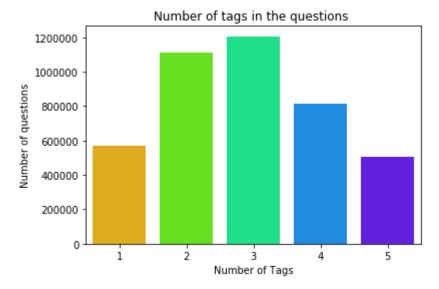

We have total 4206314 datapoints.

```
[3, 4, 2, 2, 3]
```

```
In [0]: 1 print( "Maximum number of tags per question: %d"%max(tag_quest_count))
2 print( "Minimum number of tags per question: %d"%min(tag_quest_count))
3 print( "Avg. number of tags per question: %f"% ((sum(tag_quest_count)*1.0)/le
```

Maximum number of tags per question: 5 Minimum number of tags per question: 1 Avg. number of tags per question: 2.899440

```
In [0]: 1 sns.countplot(tag_quest_count, palette='gist_rainbow')
2 plt.title("Number of tags in the questions ")
3 plt.xlabel("Number of Tags")
4 plt.ylabel("Number of questions")
5 plt.show()
```

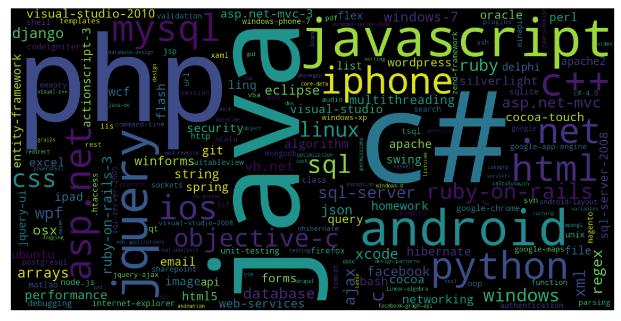

Observations:

- 1. Maximum number of tags per question: 5
- 2. Minimum number of tags per question: 1
- 3. Avg. number of tags per question: 2.899
- 4. Most of the questions are having 2 or 3 tags

3.2.5 Most Frequent Tags

```
In [0]:
             # Ploting word cloud
          2
             start = datetime.now()
          3
             # Lets first convert the 'result' dictionary to 'list of tuples'
          4
          5
             tup = dict(result.items())
             #Initializing WordCloud using frequencies of tags.
          7
             wordcloud = WordCloud(
                                       background color='black',
          8
                                       width=1600,
          9
                                       height=800,
         10
                                 ).generate_from_frequencies(tup)
         11
         12
             fig = plt.figure(figsize=(30,20))
             plt.imshow(wordcloud)
         13
         14 plt.axis('off')
             plt.tight_layout(pad=0)
         15
         16
            fig.savefig("tag.png")
         17
             plt.show()
             print("Time taken to run this cell :", datetime.now() - start)
         18
```

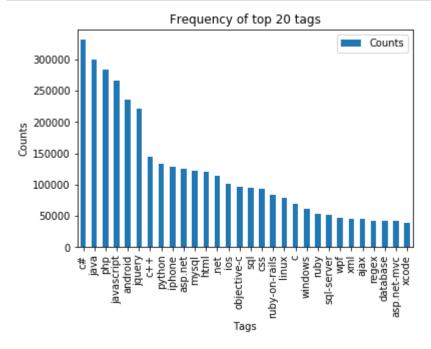

Time taken to run this cell: 0:00:05.470788

Observations:

A look at the word cloud shows that "c#", "java", "php", "asp.net", "javascript", "c++" are some of the most frequent tags.

3.2.6 The top 20 tags

Observations:

- 1. Majority of the most frequent tags are programming language.
- 2. C# is the top most frequent programming language.
- 3. Android, IOS, Linux and windows are among the top most frequent operating systems.

3.3 Cleaning and preprocessing of Questions

3.3.1 Preprocessing

- 1. Sample 1M data points
- 2. Separate out code-snippets from Body
- 3. Remove Spcial characters from Question title and description (not in code)
- 4. Remove stop words (Except 'C')
- 5. Remove HTML Tags
- 6. Convert all the characters into small letters
- 7. Use SnowballStemmer to stem the words

```

4. Machine Learning Models

4.1 Converting tags for multilabel problems

```
        X
        y1
        y2
        y3
        y4

        x1
        0
        1
        1
        0

        x1
        1
        0
        0
        0

        x1
        0
        1
        0
        0
```

We will sample the number of tags instead considering all of them (due to limitation of computing power)

```
In [0]:
             def tags_to_choose(n):
          2
                 t = multilabel_y.sum(axis=0).tolist()[0]
          3
                 sorted_tags_i = sorted(range(len(t)), key=lambda i: t[i], reverse=True)
                 multilabel_yn=multilabel_y[:,sorted_tags_i[:n]]
          4
          5
                 return multilabel_yn
          6
          7
             def questions_explained_fn(n):
          8
                 multilabel_yn = tags_to_choose(n)
                 x= multilabel yn.sum(axis=1)
          9
                 return (np.count nonzero(x==0))
         10
```

with 5500 tags we are covering 99.04 % of questions

```
In [0]: 1 multilabel_yx = tags_to_choose(5500)
2 print("number of questions that are not covered :", questions_explained_fn(55)
number of questions that are not covered : 9599 out of 999999

In [0]: 1 print("Number of tags in sample :", multilabel_y.shape[1])
2 print("number of tags taken :", multilabel_yx.shape[1],"(",(multilabel_yx.sha)
Number of tags in sample : 35422
number of tags taken : 5500 ( 15.527073570097679 %)
```

We consider top 15% tags which covers 99% of the questions

4.2 Split the data into test and train (80:20)

```
In [0]: 1 total_size=preprocessed_data.shape[0]
2 train_size=int(0.80*total_size)
3
4 x_train=preprocessed_data.head(train_size)
5 x_test=preprocessed_data.tail(total_size - train_size)
6
7 y_train = multilabel_yx[0:train_size,:]
8 y_test = multilabel_yx[train_size:total_size,:]
```

4/10/2019 SO_Tag_Predictor

```

4.5.1 Preprocessing of questions

- 1. Separate Code from Body
- 2. Remove Spcial characters from Question title and description (not in code)
- 3. Give more weightage to title: Add title three times to the question
- 4. Remove stop words (Except 'C')
- 5. Remove HTML Tags
- 6. Convert all the characters into small letters
- 7. Use SnowballStemmer to stem the words

```

5. Assignments

- 1. Use bag of words upto 4 grams and compute the micro f1 score with Logistic regression(OvR)
- 2. Perform hyperparam tuning on alpha (or lambda) for Logistic regression to improve the performance using GridSearch
- 3. Try OneVsRestClassifier with Linear-SVM (SGDClassifier with loss-hinge)

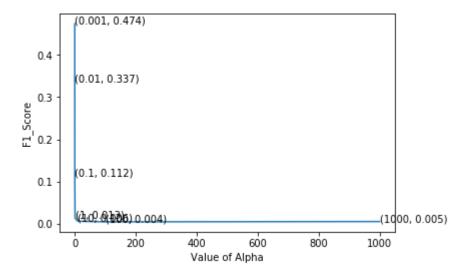

```
